# Information Systems Division

Division Head: Jovino L. de Dios

The inflow of data and information within PhilRice fuels the generation of new ideas, data, information, technologies, models, materials and practices to attain its goals and objectives. The methods used by PhilRice on how it manages its own data and information resources inspire people to generate more scientific and practical outputs. Policies, strategies and infrastructures make up the Information Systems (IS) which helps manage data, information and processes.

Several specific ISs are being developed in PhilRice internally and in collaboration with other agencies. These are generally classified as the Management Information Systems (MIS) and the Agricultural Information Systems (AIS) that assists PhilRice clients, administration, research and development, technology demonstration, technology deployment and even sales and production of rice seeds.

## **I. Site Characterization, Mapping and Information Systems for Irrigated, Rainfed, Upland and other Adverse Rice Environments**

Wilfredo B. Collado

The irrigated rice ecosystem has the most favorable environment where the yield potential is achieved, while rainfed and other adverse ecosystems have more complex conditions. Most importantly, understanding the local biophysical conditions (e.g. soil, plant, climate, biotic and abiotic stresses) through site characterization including socioeconomic parameters (e.g. land holdings, cropping calendars, varieties, seed systems, and marketing systems indigenous knowledge and practices, coping mechanisms, cultural, absorbing capacity and economic status) of the target clientele are required to identify research strategies and facilitate development of appropriate and site-specific technologies.

The above properties should be analyzed and mapped for evaluation. These are necessary in providing several information options that will serve the rice sector. Thus, the project was conceived to carry out a system of documentation, identification, characterization, quantification, categorization and mapping of the target areas.

## **Identification, biophysical characterization and mapping of rice areas of the Philippines**

WB Collado, RM Monteza, RV Bermudez, Jr. and JL de Dios

This study aimed to reassess the validated soil series for changes in climatic profile as an effect of climate change; characterize the current rice areas as irrigated, rainfed lowland, upland, saline, drought/submergence-prone areas based on Soil Taxonomy Framework; establish the productivity rating and provide suitability classifications for each soil unit for rice at defined levels of inputs and management circumstances; assess the fertility, suitability of the area for other crops and provide management requirements needed for crop production; develop a simple guidebook for easy identification of the soil based on color, texture, soil pH and other distinguishing characteristics; and improve the database of the soil series including management recommendations for online access.

### **Highlights:**

- Revalidated and characterized soil series profiles of Barcelona, Carig, Toran, Buguey in Cagayan, Moncada and Ramos in Tarlac, Brooke's, Sta. Felomena and Sevilla in Nueva Vizcaya, and Tagkawayan in Quezon;
- Developed the intermediate soil database for encoding and consolidating of validated and secondary data (physical and fertility properties; profile descriptions, crop suitability, profile pictures, productivity index, soil limitations to crop production, soil management recommendations and results of laboratory chemical analysis) needed in preparing web application of the guidebook.
- Conducted pre-testing and evaluation of the key soil series guidebook of Region 6 to different end-users from Regional to Municipal Agricultural Technicians/Officers and farmers.
- The Soil Management Subsystem was modified for better presentation and more responsive. The modified subsystem includes maps, graphics, spreadsheets, tables, guide to soil sampling, soil color determination; texture and pH determinations.
- Guidebooks for Antique, Bataan, Bulacan, and Pangasinan.

## **Characterization of the socioeconomic needs and constraints, and documentation of indigenous practices in rainfed, upland and adverse environments**

AB Mataia

This study characterizes rice farmers in the rainfed, upland and adverse rice environments in terms of socioeconomic needs and constraints. To achieve this, three sub-studies were implemented namely: 1) characterization of socioeconomic needs and constraints of rice farmers in upland and drought-prone rice environments; 2) characterization of socioeconomic needs and constraints of rice farmers in saline and submergence prone rice environments; and 3) farmers' coping mechanisms to unfavorable rice farming environments in the Philippines. Secondary data and information on basic agricultural information on specific provinces were gathered. Data were presented up to barangay level.

### **Sub-Study 1: Characterization of socioeconomic needs and constraints, and indigenous practices in drought-prone and upland rice environments**

RG Manalili, AB Mataia, RB Malasa and CP Austria

Rice-based farmers in the upland and drought-prone environments were characterized according to their socioeconomic and technological status. Constraints and opportunities in farming and coping mechanisms and their indigenous farming practices were documented and assessed. A total of 131 farmers in the upland and 155 farmers in the drought-prone environment were interviewed using a structured questionnaire covering 2011 wet season (WS) or July-December 2011 harvest and 2012 dry season (DS) or January-June 2012 harvest. Descriptive statistics such as means and frequencies were used in the preliminary data analysis.

#### **Highlights:**

- Table 1 shows that based on the farm and farmers profiles in the upland and drought-prone environments, on the average, upland and drought-prone environments farmers were farming for more than 2 decades. Upland farmers were more experienced in vegetable farming than in the drought-prone areas. Less than 50% of them are members of a farmers' organization and have attended rice related trainings/seminars for the past three years. Among the trainings/seminars attended include Farmers Field School (23-41%), PalayCheck (16-20%), Inbred Rice Production (7-14%) and Hybrid Rice Production (2-8%). More than half of the farmers (54-57%) received assistance from the government in the form of seed subsidy.
- The total land area is higher for farmers in the upland at 2.15ha compared to the drought-prone areas at 1.64 ha. Average rice area

is 0.85 hectares (ha) for upland and 1.31ha for drought prone area. Area devoted to other crops by farmers is larger in the upland areas at 0.94ha compared to only 0.20ha in the drought-prone farms. Sixty-six percent are owner-cultivators of upland farms, while only 46% are owners of drought-prone farms.

**Table 1.** Farmer and farm profile by type of environment, 2011 WS & 2012 DS.

Item	Upland	Drought-prone
<b>Farming Experience (no. of years)</b>		
Rice Farming	23	24
Vegetable Farming	11	7
<b>Membership in Organization (%)</b>	49	39
<b>Attendance to rice-related training (%)</b>	43	47
<b>Trainings/Seminars attended (%)</b>		
PalayCheck	20	16
Farmer Field School (FFS)	41	23
Inbred Rice Production	7	14
Hybrid Rice Production	2	8
<b>Received assistance from the government (%)</b>	54	57
<b>Assistance from the government (%)</b>		
Free seeds	24	23
Free Fertilizer	1	10
Seed Subsidy	58	66
Fertilizer Subsidy	4	9
<b>Farm Area</b>		
Total farm area (ha)	2.15	1.64
Total rice-based area (ha)	0.85	1.31
Total area for other crops (ha)	0.94	0.20
Idle land (ha)	0.28	0.12
Number of rice parcel	1	1
<b>Rice-based land ownership (%)</b>	66	46
<b>Cropping Pattern (%)</b>		
Double cropping	6	52
Single Cropping	32	30
Rice-Corn	43	4
Rice-Other Crops	15	12
Others	2	3

- Rice-corn (43%) ranked as the most practiced cropping pattern in the uplands, followed by rice single cropping (32%) and double rice cropping (6%). This is an opposite of the cropping patterns in the drought-prone farms where more than half of the farmers (52%) can plant rice twice in a year, 30% plant rice for only one season and 19% plant other crops during the second season.
- Table 2 shows that the use of high quality seeds (hybrid, registered and certified) is very low in both environments (ranged from 12-45%). Farmer's seed was used by 80% of the farmers in the upland during the WS and 52% of the farmers in the drought-prone areas during the DS.
- More upland farmers (51-64%) practice direct seeding in both seasons, while 35% practice dibbling only during the WS. In the drought-prone farms, transplanting and direct seeding has almost equal share of farmers' adoption for both seasons.
- The use of Leaf Color Chart is more popular in the upland (5-18%) compared to drought-prone areas (1-3%) which its adoption is still very low. In addition, many farmers (64-90%) do not have soil analysis in their rice farms. Laboratory soil analysis method was used by the farmers whose soils were analyzed. Likewise, very few farmers (12-18%) used organic fertilizer in rice.
- Almost all of the farmers relied entirely on rainfall as water source, though some farmers in drought-prone areas utilize irrigation water from pumps (10-13%) and small water impoundments (SWI)/small farm reservoir (SFR) (1-4%).
- Average area planted during the WS was 0.72ha for upland and 1.04 ha for drought-prone. Rice yield obtained was low in both environments. Farmers in the upland obtained yield of 2.15 t/ha-1 during the WS and 2.62 t/ha-1 during the DS. The average yield in the drought-prone was 2.94 ton ha-1 and 2.16 t/ha-1 during WS and DS, respectively.

**Table 2.** Farm practices and yield by environment, 2011 WS and 2012 DS.

	Upland (%)		Drought-prone (%)	
	2011 WS	2012 DS	2011 WS	2012 DS

## **Sub-Study 2: Characterization of socioeconomic needs and constraints, and indigenous practices in submergence-prone and saline environments**

RB Malasa, AB Mataia, RG Manalili, CN Austria, and MRV Lopez

In support to the Food Staple Rice-Self-Sufficiency Road Map, PhilRice develops specific technologies that will break the low yield barrier in adverse environments. This study is focused on characterizing the socioeconomic and farming practices of submergence-prone and saline environments. The study works on the inventory of existing socioeconomic data and information on submergence-prone and saline environments; identify socioeconomic needs, constraints and opportunities of farming households; document the indigenous production and post-production practices of the farming households; document and understand the roles and motivations of various stakeholders involved in technology transfer; and identify policy recommendations to improve productivity and sustained development.

There were 58 respondents from submergence-prone and 66 respondents from saline environments.

### **Highlights:**

- Table 3 shows that the rice farming experience of the respondents in both adverse environments is around three decades. Farmers in submergence-prone areas is almost a decade (8.71 years) in vegetable farming as opposed to those in saline areas are have relatively new (3.52 years).
- Almost all of the farm area of the respondents is allotted for rice. Regardless of type of environment, the rice area is greater than 2 (ha).

**Table 3.** Farming characteristics by type of environment.

Items	Environment	
	Submergence-prone	Saline
<b>Farming experience (years)</b>		
Rice farming experience	27.86	30.15
Vegetable farming experience	8.71	3.52
<b>Area (ha)</b>		
Total area	2.54	2.50
Rice area	2.35	2.38
Other area	0.19	0.15
Idle area	0.01	0.01
No. of rice parcels	1.50	1.56
<b>Yield (t/ha)</b>		
Yield (2011 WS)	2.98	2.66
Yield (2012 DS)	2.99	2.92

- The yield level of farmers in saline areas is less than 0.26t/ha in July to December 2011 as opposed to January to June 2012. Low yield level (less than 3t/ha) was common for both environments.
- Table 4 reveals that 60% of farmers in submergence-prone environment and 59% in saline environment have training in rice vegetable production from 2009 to 2011. In the submergence-prone area, 33% of the farmers had attended a PalayCheck training followed by FFS (21%). In saline areas, 20% of the farmers attended PalayCheck training followed by hybrid rice production (14%) and inbred rice production (11%).

**Table 4.** Training/seminar participation by type of environment (%).

Training/seminar	Environment	
	Submergence-prone (%)	Saline (%)
PalayCheck	33	20
Farmers' field school	21	9
Inbred rice production	3	11
Hybrid rice production	3	14
Others	0	6
None	40	41

- Around 76% of farmers in submergence-prone areas can plant rice for two seasons and around 50% of the farmers in saline areas. While 45% can only engage in one cropping in saline areas.

- An in-depth scrutiny of the yield levels of the farmers show that regardless of environment and season, more than 50% of the farmers who planted rice were not able to reach 3t/ha. However, there are more farmers who experienced low yield in the saline areas and this is consistent regardless of season.
- Table 5 reveals that in terms of the use of high quality seeds, more farmers in saline areas, use hybrid, and certified seeds. On the other hand, more farmers use low quality seeds (good seeds and farmer’s seeds) in submergence-prone areas.
- More than 80% of the farmers, are non-users of LCC. Many of them do not analyze their soil and do not use organic fertilizer.

**Table 5.** Cropping pattern by type of environment (%).

Cropping pattern	Environment	
	Submergence-prone (%)	Saline (%)
double cropping	76	50
single cropping	14	45
rice-corn	3	5
rice-other crops	7	0

**Sub-Study 3: Farmers’ coping mechanisms to unfavorable rice farming environments in the Philippines**

ABMataia, RGManalili, RBMalasa and MRVLopez

With the increases in changing climate patterns and the incidence of notable climate episodes, these unfavorable rice environments are expected to be more vulnerable to different risks in the future and further exposing farmers in these environments to production and consumption risks and poverty. This study aimed to determine coping mechanisms of rice-based farming households in different unfavorable environments for better planning of adaptation strategies, and to assess the impacts of adverse conditions on rice yield and productivity. The study was conducted in 15 major rice producing provinces with large rice areas of unfavorable conditions. The provinces are: Ilocos Norte, Pangasinan, Isabela, Cagayan, Pampanga, Zambales, Camarines Sur, Iloilo, Capiz, Bohol, Leyte, Northern Samar, North Cotabato, Agusan del Sur, and Zamboanga del Sur with a total samples of 657.

## Highlights:

- The sample farmer's average cultivated rice areas are 1.52 hectares with landholding range of 0.10 to 18 hectares. Farmers with small rice areas are more vulnerable to increasing climate variability if rice farming is the only source of livelihood. Across environments, average rice landholdings are smaller in the uplands (0.85ha) while farmers in the submergence prone areas have relatively bigger average rice area (1.61ha) (Table 6a and 6b).

**Table 6a.** Yield levels by type of environment, 2011 WS and 2012 DS (%).

Yield level/season	Environment	
	Submergence-prone (%)	Saline (%)
<b>Yield level (2011 WS)</b>		
< 3 t/ha	52	58
? 3 t/ha	48	42
<b>Yield level (2012 DS)</b>		
< 3 t/ha	51	55
? 3 t/ha	49	45

**Table 6b.** Farm practices by environment, 2011 WS and 2012 DS.

No Response	2	4	0	3

- Majority of the sample farmers experienced a range of abiotic stresses such as: drought, flood and soil salinity in the last three years, which have great impacts on their rice yield and production.
- The impacts of the abiotic stresses (Table 7) are assessed on the size of affected areas, particular on rice yield and total production during the latest cases of stresses. On drought, there was a 20% reduction in cultivated rice areas, while a reduction of around 53% and 43% in total production and yield, respectively. The flood decreased rice areas by around 20%, which translated to a declined in yield by 48% and total production by 61%. The drought-flood was recorded a reduction of 27% in rice areas, while a plunged of 44% in total production and 42% in yield. Soil salinity has also great impacts, which decreased rice areas by 27% with a reduction of 42% in total production and 25% in yield. In upland related stresses decreased rice areas by 11%, total production by 45% and yield by 40%. Overall, flood has the biggest negative impacts in rice production as this occurred frequently than the other stresses.
- Many sample farmers deployed different adaptation strategies before (ex-ante) and after (ex-post) stress occurred to cope with its impacts. The ex-ante strategies are proactive measures that are employed before stress occurs while coping mechanisms or ex-post strategies employed after a stress occurs. Specifically, ex-ante strategies are adapted to reduce production shortfall to help lessen the fluctuations in rice farm income, while ex-post strategies are employed to smoothen consumption.
- Most common ex-ante strategies adapted by farmers across unfavorable environments include: investment in backyard livestock; make temporal adjustments in cropping patterns based on timing of drought/flood/salinity occurrence; maintain financial reserves; engagement on off-farm employment; accumulation of stocks in good years, practice crop diversification and avoiding expensive investments. Additionally, farmers employed ex-ante coping strategies such as careful choice of rice variety tolerant to specific stress; adjustment in cropping calendar to synchronize with crop planting and growing period; and adoption of new technologies. Other farmers did not do any coping strategies because they lack the knowledge or information about it.
- The most ex-post coping strategies adapted by farmers are: avail loan to finance capital requirements of the crop; engage on off-farm employment of other household members; drawing from savings; selling of livestock; reducing food budget and children school allowance.

**Table 7.** Impacts of stress or adverse condition to rice production, 2012.

Items	Unfavorable Conditions				
	Drought	Submergence	Drought-Submergence	Salinity	Upland
Normal Area (ha)	1.13	1.62	0.75	1.42	0.79

### Decision support system for intensive rice-based farming system

RC Castro, JM Maloom, MJC Vives, HJP Agngarayngay, EP Agres, BM Catudan, ND Ganotisi, AC Aguinaldo, AY Alibuyog, NQ Abrogena, NR Alibuyog and CO Iglesia

The vulnerability of rice-based cropping system in Ilocos to climate forces which include pests and diseases were assessed and done in six activities namely, (1) Delineation of flood, drought and saline prone areas in Ilocos Norte using GIS-based mapping technique coupled with community interviews and instrumentation; (2) Simulating the growth and yield performance of selected rice-based cropping system using DSSAT under different climate change scenario; (3) Groundwater monitoring, characterization and supply forecasting; (4) Local weather monitoring and forecasting; (5) Development of webGIS-based Integrated Climate Change Information System and (6) Defining pest management strategies in stress-prone environments of Northwest Luzon

The main objective of this project is to create a decision support group. The group provides advisories to prevent losses due to adverse weather conditions, pest and diseases, and price fluctuations; apply the correct residual measures or amounts of inputs to the crops, livestock, poultry and fishes at the right time, consequently increase the income of the farmers, provide more and better quality farm products, and sustain ecological balance.

## Highlights:

### *Delineation of drought, flood and saline-prone areas in Ilocos Norte*

Field surveys were conducted in the drought, flood- and saline-prone areas of Ilocos Norte with 69 barangays classified as flooded, 19 as saline and 62 as drought-prone. The list of barangays affected by the different adverse environments were provided by the Municipal Agriculture Officers from different municipalities of Ilocos Norte and an electronic map on flood-prone areas was requested thru NEDA-I. These served as the basis for the conduct of actual survey and interview of farmer respondents.

- Downloaded satellite images of the different municipalities of Ilocos Norte from Google Earth; printed poster size maps of 30% of the municipalities covered for delineation of the three adverse environments;
- Prepared the flood hazard map of Ilocos Norte.

**Figure 1.** Simulating the growth and yield performance of selected rice-based cropping system using DSSAT under different climate change scenarios

- Established experimentation for rice (PSB Rc82 and IR64) and corn (Pioneer 280 (hybrid) and OPV (glutinous) for the identification of their genetic coefficients
- Gathered, recorded and organized agronomic and yield data for both rice and corn for inputting of data sets in the DSSAT software; A comparison of the result will be made from that of the observed and generated data from the DSSAT model.

**Figure 2.** Experimental set-up for the localization of the DSSAT model for rice in PhilRice-Batac, Ilocos Norte. 2012 Dry Season.

- Established experiments for rice and corn for the identification of their genetic coefficients using the widely used varieties in Ilocos Norte, rice: PSB Rc82 and IR64; corn: Pioneer 280 (hybrid) and OPV (glutinous) and gathered, recorded and organized the agronomic and yield data for inputting of data sets in the DSSAT software;

#### *Ground water monitoring, characterization and supply forecasting*

- Identified and established a network of shallow tube wells (STWs) in the province of Ilocos Norte and 1st District of Ilocos Sur that served as the monitoring sites for gathering data on groundwater level; initially, each municipality had 5 observation wells to represent the agricultural areas using pump for irrigation. A total of 85 wells were identified, measured and mapped;
- Out of 23 municipalities of Ilocos Norte, there were seven identified municipalities that are not using STW (Pagudpud, Dumalneg, Adams, Carasi, Solsona, Banna and Nueva Era); surface water was used to water their farm instead of STWs.
- Eighty five wells were identified in Ilocos Norte (were 41 for the 1st District and 30 for the 2nd district, while 14 for 1st district of Ilocos Sur).

- Installed four (4) units of Automatic Weather Stations in the eastern municipalities of Ilocos Norte such as Solsona, Marcos, Banna, and Nueva Era; these sites were prioritized because rainfall in these areas is much earlier and abundant as compared to northern and southwestern part of the province.
- Agri-weather data such as rainfall, temperature, relative humidity and barometric pressure from these municipalities and existing rainfall/weather station thru PAGASA, Laoag City were downloaded regularly for consolidation needed for the localized weather advisories for the farmers;

#### Development of webGIS-based climate change information system

- Gathered and consolidated data on yield, soil, water and climate, vulnerability maps as well as adaptation and mitigation measures developed, and best farming practices in mitigating climate change impacts in Ilocos Norte;
- Coordinated with MMSU for the development of the webGIS facility that will be accessed by PhilRice stations in the future
- Started the development of the PhilRice Integrated Climate Change Information Center.

## **II. Development and Innovation of Rice Database and On-Line Information Systems**

Jovino L de Dios

Digital technology gives way to the inter-linking of several information and communications components and systems into one for economy and efficiency. Examples are the internet, short messaging service (SMS), Camera-phone, Global Positioning System (GPS)-cameras, wireless local area network (WLAN), Remote Sensing Systems, and online database systems. These are used to collect, transmit, store, and present data and information real-time or near-real-time to a wide range of stakeholders, from farmers to decision-makers regardless of geographical location and time. In terms of application, this is almost more than the boundary of a unified communication platform which is “communications integrated to optimize business processes,” ([http://en.wikipedia.org/wiki/Unified\\_communications](http://en.wikipedia.org/wiki/Unified_communications)).

Digital data content are important when developing agricultural information systems. Site-specific field data are necessary when farmers require site-specific decision support. For example, a growth model may require soil and fertilization information from the target area for better recommendation.

Common and frequently used gadgets, like smartphones, are also used to create tools to help in rice production, seed distribution, field assessments, information dissemination, etc.

Use of information systems in collection, transmission, organization, storage, and retrieval of field data and information from multiple sites  
AC Arocena Jr., LdR Abaoag, SR Brena, and EB Sibayan

### Highlights:

#### *PhilRice Vehicle Information Systems*

- Enhanced the PhilRice Vehicle Information System to comply with the new requirements of the vehicle dispatch unit.
- Transformed the stand-alone database system to an online Information System.
- Restructured the database, presentation and printing modules of the IS.
- Established a working model for public users of the dispatch system.
- Perform initial inventory of the sales and warehouse operational process, equipment requirement and reports generated.
- Recommended equipment requirements.
- Improved the process flow to validate conformity of suggested check points with existing process.
- Restructured the database systems to incorporate barcoding.
- Gathering useful toolkits to better implement modification to the system.
- Conducted orientation and immediate response to queries from different stations.
- Enhanced the barcode layout of rice wine barcode.
- Redesigned the PBDO Point Of Sale and Warehouse Database Systems including Seed Ordering sub-systems module, Purchase order releasing sub-systems module, and Payment sub-systems module.

*Mobile-phone Applications Development (Apps Dev)*

- Developed a prototype for gathering GPS coordinates using SMS as mode of transmitting data into a database.
- Concept proof the developed application in Bulacan, Pampanga, Nueva Ecija and Tarlac provinces.

**Development of Online Rice Research and Development Abstract Information System**

MA Gacutan, T L Briones, and RZ Relado

The online rice research and development abstract information system is a web-based management information systems that monitors reports and protocols of programs, projects and studies. It is an interactive portal where reports can be submitted and status can be tracked. It has different access privileges and customized user interface based on log-in credentials. Project and Program Leaders can monitor submitted reports and has the privilege to check, put remarks or accept submitted reports. The Planning and Collaborative Projects Office can monitor status, track history, view profile (study, project, program), update and manage the reports and protocols submitted.

**Highlights:**

- Graphical user interface for study or project or program leader for uploading and monitoring reports and protocols were made.
- Planning and Collaborative Project Office Interface for Project Monitoring – reports and protocols monitoring page as general view to check and monitor whether if they already submitted protocols or reports were made.
- Project Manager Page Option – page to update/add new list of study/project/program, add remarks, track history, monitors status, view profile and delete projects profile were made.
- SED Databank. Web-based repository of SED papers and articles, published and unpublished. Uploaded documents are searchable and can be downloaded. Documents are also categorized in different accessibility. Initial data were uploaded and at present it was being evaluated and tested for improvement.
- Established a stand-alone version of the Document Management and PhilRice Document Tracking Subsystem and deployed these subsystems to PhilRice-Isabela, the version serves as back-up in case internet connectivity is not available.
- Updated the Farmer's Q and A database.

- Created a database build-up of 15th to 25th R&D conference participants.

#### *Gene Bank Management Information System (GEMS)*

Report Monitoring System was added in GEMS. It monitors the monthly movement of accessions and collections Gene Bank. Reports are in tabular and graphical formats that can be printed or downloaded.

#### **Computer-aided Farm Operations Management and Maintenance System**

AC Arocena Jr.

Farm operations performed in research and seed production farms are tedious tasks. Manual monitoring and scheduling of farm activity requests, progress and accomplishments takes a lot of time and effort. Similarly, farm equipment maintenance and status checks needs equal importance for smooth field operations. The implementation of a computer-aided farm operations management and maintenance system can facilitate feedback and monitoring processes.

The efficiency offered by database driven inputting module systematically organizes and stores data and processes. The equipment inventory subsystem provides equipment monitoring and maintenance scheduling to maintain the top conditions of farm equipment. These can maximize the use of resources and systematically document the processes for improvement.

This console can also be used to post activity requests, accomplishments, problems observed, and can also serve as internal communication channel by the FOM unit with concerned staff.

The FOM task manager can be accessed online for remote monitoring of the progress of field operations and can possibly integrate a cellphone-based requests form to increase its functionality.

#### **Highlights:**

- Performed modification on the systems request inputting form to simplify farm activity request for researcher.
- Established a more stable user management system to accommodate all PhilRice staff and researchers.
- Started concept design on the development of a farm machinery inventory and management sub-system, the component which will

complete the transformation of the FOM Task Manager into FOM Information Systems.

- Gathered data and information required for the development of the machine inventory system.
- Established a prototype for the machine inventory system.

### **Electronic map creation and conversion for interactive GIS-aided presentation**

AC Arocena Jr., WB Collado, MA Gacutan, and JL de Dios

Maps visualize the spatial distribution of any data throughout an area. It is mostly used for land evaluation, spatial planning and agricultural research, development and extension activities. Through information technology, interactive electronic maps are now becoming commonly available online which are free and easy-to-use. Maps clearly present, summarized or detailed geo-related information from specific location anywhere in the world. It is generally being developed using geographic information system (GIS) and/or Geographic positioning system (GPS) technologies which allows more interactivity among users and developers. The study aims to establish an interactive GIS mashup as geo-referenced data presentation through the internet.

#### **Highlights:**

- Established a web-link for easy accessibility of the converted maps
- Established partial map for PhilRice projects sites map in kml format.
- Provide PhilRice projects site map to Devcomm and ODEDD.
- Created the Index of maps, KML file of PhilRice field map overlaid in Google Earth, and Rice project sites map overlaid in Google Earth application

### **Improving the security, viability and connectivity of the PhilRice e-Data**

JL de Dios, LA Tamani, and AC Arocena Jr.

Information Systems (IS) is an essential tool to properly administer processes and manage data within an organization. This project maintained and secured the PhilRice information systems and its components like servers, network equipment and internet connections to be viable all the time to effectively share data and information online. This ensured the PhilRice web presence to enable clients to access valuable information 24/7. The study also established a system of data security against man-made natural causes of data losses.

### Highlights:

- Redesigned the ICT operations policy, and strategy to optimize the local area network performance. Prioritized the internet connections and bandwidth utilization among servers, browsers and wireless local area network. Established several Wifi hotspots in strategic places within PhilRice CES for wireless access.
- Upgraded the internet connections of PhilRice Branches and PhilRice CES by 30%.
- Performed data and system back-up regularly and implemented a more complex user access management.
- Deployed several Network Attached Storage System for data backup and redundancy on storage.
- Developed a system of bandwidth usage monitoring and analysis to decongest the system.

### *Corporate Website Technical Maintenance*

- Configured additional features and enhancement of PhilRice website backend and content administrator functionalities. Inserted the thumbnail label/field for the homepage articles. Created the staff profile database and form for managing staff profiles. Developed the rice science database and form for managing rice science page. Provided technical assistance to PhilRice corporate website for upgrade and enhancement concerns. Evaluated and configured a news mailer for sending electronic articles to PhilRice partners and stakeholders.
- Developed a system of performance monitoring of the corporate servers using Google analytics starting August 2012. Data shows that there were 80,834 visits to the website by 27,527 unique people. There were also 32.61% new visitors and 67.39% as returning with an average visit duration of 4:14 minutes.

### *Lakbay Palay Web based Evaluation*

A web-based evaluation form was developed based on the survey used during field days and Lakbay Palay and was tested in October 2012 field day with 30 respondents. This prototype system can also be used to other processes with the same purpose.

## **PhilRice Hybrid Library Science and Services**

E Joshi and V Salvador

Online library. Continuous improvement of the library web page is being undertaken. Several additions to the original are being done to upgrade and further improve its contents. It now includes the Rice Centennial Bibliography as well as other useful sites for researchers. Currently developing the library website and management system for backup and transfer of some data to web-based applications for accessibility and availability of information.

### **Highlights:**

- Proquest usage and literature search. There were 1,469 recorded searches with 481 downloaded citations/ abstracts and 4,146 full-text articles. A total of 4,649 articles/citations were downloaded. Average unique searches is 147 per month. Recorded searches in OPAC within the Library is 207 with the increase of virtual usage by staff.
- Clippings database. Newspaper clippings of around 725 pertaining to rice and PhilRice were scanned and uploaded to the database.
- Organization of library materials and database management. Cataloged publications total of 1,165 comprising of 505 books, 656 reprints and 4 journal titles. Barcoded publications entered in the Destiny software is: 6,157 volumes (4,982 titles) and the software was upgraded to 10.1 version.
- Current Awareness Service. Daily News Monitor was serviced to top management. Requests were also made to complete articles to DA-AFIS upon request. These news items were also posted in the Library Bulletin Board. Ninety-seven PhilRice articles, 1,437 rice articles were collected and posted, and circulated 46 content pages with rice articles via email.
- Reports and PhilRice Milestones 2011. Contributed for the annual report (Milestones) the citation study indicating the top 10 most cited PhilRice staff. This is important in evaluating significance of research work of scientists to others as well as providing information to our staff with CSC and Magna Carta concerns. Two new requests for citation reports of N Manigbas and C Asis were made for the CSC-Magna Carta.
- Library Networking. Enrolled as a member of the Philippine Association of Academic and Research Libraries Network (PAARLNET). This network enables PhilRice to avail of interlibrary

loan service and address journal article requests. .

- **Indexed Articles.** A total of 434 articles were indexed and content pages emailed to staff (517 pdf files were downloaded, 80 were uploaded in the Greenstone database).
- **Collection Development.** Acquired a total of 4,636 materials consisting of 1,527 books; 751 journal issues; 525 reprints/pamphlets; 12 special materials; and 1821 newspapers. More than 300 books on economics and 28 children's books for the PhilRice Daycare Center were solicited from Yale University..
- **Circulation.** Loaned 1,424 books, 2,098 journals, and 198 mixed materials for room reading to outsiders, with a total of 3526 circulated materials.
- **PhilRice Magazine.** Contributed article on energy for inclusion as Global Update and also provided materials to writers as well as staff from ODED R & D used for proposals on energy. The issue devoted on communication and IT did not include Global Update.

### **Near-Real Time Rice Seed Information Support System for Region III**

AC Arocena Jr., JL de Dios, DA-RFU III, NIA-PIO III, and NSQCS

A strong multi-agency collaboration to deliver near-real-time information can be established using the state-of-the-art and existing communication systems like short messaging services (SMS), multimedia services (MMS) and the internet or "cloud" in capturing, transmitting, organizing, database building and presenting field data and observations to intended users. The project aims to establish an effective electronic information system tools using the commonly available information infrastructures to facilitate data collection, data transfer, project feedback mechanisms and monitoring

#### **Highlights:**

- Conceptual Process Flow was formulated. Data coming from multi-mode collection platforms (cellphone forms and web-forms) transmit through GSM and the internet will ensure that it will be received by the server. These data will pass through processing interface for data organization before being stored into the database. Stored data are processed into information with different level of access to each user type.
- Inventories and equipment needed were prepared, which include: 25 units smartphones with Symbian OS', 1 unit smartphone with Android OS and 125 units 4Gb microSD memory card.

- Secondary data of Inventory of Irrigators Association and water sources by irrigation systems from NIA-PIO and Updated list of seed growers in region III from NSQCS were acquired.
- In application development aspect, the following were done:
  1. Established systems and data collection process flow
  2. Installed and configured the receiving module for the cellphone-based data capture infrastructure.
  3. Developed database and table structure for organization and storage of received data.
  4. Developed 2 cell-phone based apps for GPS data collection.
  5. Developed the preliminary (Stage 1) and final (Stage 2) data gathering form.
  6. Developed a process to automatically organize and store received data into the structured database.
  7. Concept proofed the developed apps in some seed growers from Pampanga, Bulacan, Nueva Ecija and Tarlac.
  8. Started GPS data gathering of seed growers household, trading post and seed production lots
  9. The project proponents meet with Mr. Nelson Bautista (Region III Seed Coordinator) together with Region III Provincial Seed Coordinators.
  10. Developed the Geographical Position System and field data gathering e-forms.

## **Strategic Assessment of Yield-Limiting and Reducing Factors in the Philippines**

RO Mabalay and EJP Quilang

GIS and Remote Sensing related activities

- Mapped the rice areas of the Philippines at high spatial resolution using SAR imagery. IRRI and PhilRice, and Sarmap developed a rice extent map of the Philippines at approximately 1ha resolution. An accuracy assessment covering 17 provinces was conducted by PhilRice and IRRI staff from 15 Oct to 7 Dec 2012. The validation sites are shown in figure 4. The final accuracy assessment and map will be made available to the DA in mid 2013.

**Figure 3.** The rice extent map for the Philippines

**Figure 4.** Validation sites Build capacity in PhilRice/IRRI for rice mapping

### *Build capacity in PhilRice/IRRI for rice mapping*

The 3rd training course on RICEScape version 5.0 to include the: 1) the temporal and spatial based criteria for the automatic selection of the acquisitions of interest from an existing database, for all supported sensors and acquisition modes; 2) the time series method of data processing approach to get the best results from large ENVISAT ASAR acquisition series; and 3) simplified and better performing classification procedure with respect to the previous versions. The 4th training (for one IRRI and one PhilRice staff) was conducted on August 27-September 7 at Sarmap headquarters in Purasca, Switzerland to provide the new updates on the software particularly the integration of MODIS data with SAR data for the determination of the phenological characteristics of rice per cropping season.

Yield and yield gap assessments using simulation modeling won the 1st prize in the CSSP 2012 conference in the downstream research poster category. It was tested whether the spatial and seasonal variability in yield and yield gaps from 2006 to 2010 can be modelled using three independent but complementary sources of information: official statistics, household survey data, and a crop growth simulation model. The study aimed to demonstrate how these data can be used to map yield gaps and to target appropriate interventions. There were minimal differences between BAS yield statistics and average farm level yields (Table 8). ANOVA results (Table 9) suggested that actual yields from BAS and the surveys were comparable, thus confirming that BAS estimates are representative of farmers' reported yields and could be used in the subsequent experiments.

Table 8. Comparison between farm household survey data and BAS provincial yields.

Province	Year	Season	Water source	Household yield (t ha <sup>-1</sup> )		BAS yield (t ha <sup>-1</sup> )	Yield difference (t ha <sup>-1</sup> )
				Average	Standard deviation		
Bulacan	2008	Wet	Rainfed	3.78	1.56	4.00	0.22
Laguna	2006	Dry	Irrigated	4.49	1.59	4.63	0.14
Nueva Ecija	2008	Wet	Irrigated	4.57	0.87	4.61	0.04
Pangasinan	2007	Dry	Irrigated	3.71	1.96	4.01	0.30

**Table 9.** ANOVA between farm household survey

	Df	Sum Sq	Mean Sq	F value	Pr(>F)
Yield group	1	0.569	0.569	1.989	0.167
Residuals	38	10.873	0.286		

- The ORYZA2000 could also simulate actual yields with acceptable accuracy using information from available survey data to parameterize the simulation with observed management situations. The positive difference between simulated actual yields and BAS reported yields (Table 10) were attributed to socioeconomic and biophysical constraints not accounted for in the model such as nutrient deficiencies (other than that of nitrogen), lodging, salinity, submergence, pests, diseases, and weeds. The higher simulated yields during dry seasons are due to overestimated solar radiation.

**Table 10.** Differences between actual yield simulation and BAS yield statistics (t ha<sup>-1</sup>). <sup>a</sup>

Water source/ Season	Average	Year				
		2006	2007	2008	2009	2010
Rainfed	0.37±0.03					
Wet season	0.22±0.04	0.21±0.09	0.00±0.08	0.28±0.09	0.43±0.09	0.19±0.09
Dry season	0.56±0.06	0.29±0.11	0.70±0.12	0.73±0.13	0.20±0.11	0.88±0.12
Irrigated	1.48±0.04					
Wet season	1.15±0.04	0.99±0.09	0.95±0.10	1.20±0.10	1.38±0.09	1.22±0.09
Dry season	1.82±0.05	1.76±0.12	1.72±0.11	1.79±0.11	1.95±0.11	1.89±0.12

- Yield gaps varied in magnitude from 2.5 to 8.8 t ha<sup>-1</sup>. Figure 3 shows this variation by province, by water source, and by season as maps of the average yield gap (2006-10) and box plots of the yield gap by year. The provincial maps were distorted relative to their rice production to emphasize high-production provinces that still suffer from high yield gaps.
- Rainfed yield gaps were higher than irrigated yield gaps in the top rainfed provinces in the Visayas (Iloilo, Capiz, Leyte) and Mindanao (Maguindanao) – varying from 4 to 8 t ha<sup>-1</sup> across wet and dry seasons. Central Luzon and other provinces in Luzon, which are major producers of irrigated rice, had relatively lower yield gaps that ranged between 3 and 5 t ha<sup>-1</sup> (except for Cagayan and Isabela with yield gaps between 5 and 7 t ha<sup>-1</sup>).

**Figure. 6.** Maps and corresponding box plots, by water source and by season.

### *Crop health related activities*

The assessment of crop health in the Philippines involved three main elements: The training and rebuilding of a national capacity to diagnose crop health in a holistic manner; (2) Conduct of RICE-PRE trials in IRRI and PhilRice stations aimed at testing this strategic decision tool for crop health management, and (3) The conduct of surveys in farmers' fields to assess yield-limiting and yield-reducing factors and yield.

#### *Training*

There were five local workshops and one foreign held in Vietnam. The general objectives of these trainings/workshops were to: 1) share basic knowledge on rice diseases, animal pests, and weeds, 2) demonstrate the identification of rice diseases, animal pests, and weeds, 3) demonstrate procedure for collecting data on crop health and production situation in farmers' fields using the IRRI Crop Health Characterization Portfolio, 4) share information on crop health management, 5) train participants in data processing, and 6) share methods in data analysis and modeling.

#### *RICE-PRE trials*

Yield loss that is often experienced by rice farmers in developing countries can be prevented with proper diagnosis of crop health. Availability of crop health specialist is usually lacking in most areas

and often farmers would get advice from pesticide and fertilizer agent or distributor. To help, RICE-PRE (Rice Epidemic Prevention) was developed, a strategic decision tool that prescribes a set of recommendations that contain the list of strategies for crop production and crop protection aimed at decreasing yield losses. Each prescription was created based on the combination of several elements namely: 1) rice agro-ecology; 2) agricultural objectives; 3) major pests; 4) crop management options and; 5) the most appropriate pest management options available.

The RICE-PRE prescriptions were derived from survey results in rice fields in Asia that showed a very strong statistical link between pest syndromes and the production situations in spite of a broad range of environments and highly diverse injuries caused by harmful agents. The prescriptions recommend the use of resistant varieties whenever available against the major pests that are expected to be production constraints. It is only when resistant varieties are not available and risk of injuries is unacceptably high that judicious pesticide use is recommended.

- Preliminary results of field experiments conducted at IRRI, PhilRice Nueva Ecija, PhilRice Negros and PhilRice Agusan during 2012 dry season showed a 10.5% yield advantage of RICE-PRE treatment over conventional farmers' practice. This indicated the promising potential of the use of RICE-PRE system in farmers' fields. The results of this trial were presented at two conferences in 2012, in the American Phytopathological Society meeting and in IRRI Young Scientist Conference. The experiment is currently in its third season.

### *Surveys of Farmers' Fields*

IRRI and PhilRice surveyed a total of 391 farmers' fields were surveyed from 2009 to 2012 covering at least six cropping seasons. Surveys were conducted in Agusan del Norte (ADN), Iloilo (ILO), Isabela and Cagayan (ISC), Nueva Ecija (NUE), Negros Occidental (NOC), North Cotabato and South Cotabato (COT). Data on crop health and production situation were collected according to the procedure described in the IRRI Crop Health Characterization Portfolio.

- The survey results from 2009 to 2011 showed that yield differed between seasons ( $X^2 = 46.86$ ,  $p = 1.69e-07$ ). Yield varied across seasons: 3.4, 4.7 and 5.1  $t/ha^{-1}$ . Yield also differed between provinces ( $X^2 = 69.53$ ,  $p = 2.17e-07$ ). The highest yield was obtained in ISC at 6.9  $t/ha^{-1}$  and the lowest was obtained in NOC at 4.0  $t/ha^{-1}$ . Yield in ISC, NOC and NUE was higher in the dry season than in the rainy

season. However, in ILO, the yield was almost two times higher in the rainy season than in the dry season.

- Four clusters each of injury profiles and production situations (represented by a set of cropping practices) were identified using cluster analysis. These clusters correspond to different levels and nature of injuries and production situations. Results show that clusters of injury profiles were significantly associated with clusters of production situations ( $X^2 = 25.16$ ,  $P = 0.003$ ). Province was associated with clusters of injury profiles ( $X^2 = 149.24$ ,  $P < 2.2e-16$ ) and with clusters of production situations ( $X^2 = 64.99$ ,  $P = 1.449e-10$ ). The association between these clusters and province are further analyzed using correspondence analysis.
- Correspondence analysis was performed to visualize and analyze the statistical association between the clusters of injury profiles, clusters of production situations, and provinces. NUE is closely associated with CLUSPS1 and CLUSPS3 (maximum P, maximum K, below average N, below average HU) and with CLUSIP2 and CLUSIP3. CLUSPS2 and CLUSPS4 are location-specific because these clusters are strongly associated only with ADN and ILO, respectively, whereas CLUSPS3 is not location-specific because it is associated with both ADN and NUE. Fields in ILO and COT have distinct injury profiles and production situations, whereas fields in NUE have characteristics that are similar to those in other provinces. The close association with clusters of injury profiles with clusters of production situation further supports that pest management strategies should be based of crop management.

### **Development of Information System Strategic Plan (ISSP)**

The ISSP Technical Working Group Headed by JL de Dios

To support PhilRice mandates, the power and potentials of Information and Communications Technologies (ICT) in creating its information systems (IS) projects should be tapped. This makes PhilRice's services accessible anytime and anywhere in the world to all its users, clients, stakeholders, partners, users, employees, citizens, and the general public.

The ISSP started its development in the third quarter of 2012 and at around 75% completion as of December 2012. Applications Development (Apps Dev) comprises 50 to 70 % of the plan of work while the rest is for infrastructure development that focuses on inter-branch connectivity and system redundancy and security development.

## Highlights:

- Formulation and creation of Mission Critical Information Systems (IS) that empower the clients to transact with PhilRice electronically regardless of place and time. These IS comprise of front-end and back-end systems with integrating databases and interfaces for scalability. Central to this is the PhilRice Web Portal that conforms to e-Government Stage 3 metric which is highly transactional and citizen-centric. The front-end revolves around clients like farmers, allied workers, trainees, business partners and so forth, while the backend revolves around PhilRice staffers from all branches and collaborators for internal operations and usage. The IS shall take advantage of the internet protocol (IP) and wireless or mobile technologies.
- Conceptualization and/or revision of Policies, Standards and & Procedures based on well known and acceptable standards to govern the access, use, maintenance and overall security of the agency's IS. The policy establishes the protocols for transacting with the agency for PhilRice employees and its clients.
- Database restructuring, data cleansing, migration, and buildup to create a "renewed" database while the previous databases are being cleansed for migration and later integration with the "new" database. This guarantee that both databases are thoroughly "sanitized" before being used by the IS to be developed while no existing data being lost.
- Revisiting the ICT infrastructure to establishment the basic and necessary physical and system's infrastructure in preparation for the deployment of the agency's mission critical IS. This will provide facilities for PhilRice clients, trainees, business partners, employees and other users and stakeholders to avail of PhilRice's services on a 24x7 basis. Information system networks for development should be in compliance with the internet protocol version 6 for future development and technical turn over.
- The Disaster Recovery Facility (DRF) to guarantee the continuity of service to all stakeholders. Besides, security of information ensures the confidentiality, availability and integrity of the clients' supplied information. System backup management plan and Security assessment and vulnerability testing are important part of the general plan in consideration. Secured PhilRice Information Systems shall conform to ISO 27001 Security Framework.

## Abbreviations and acronymns

ABA – Abscicic acid	EMBI – effective microorganism-based inoculant
Ac – anther culture	EPI – early panicle initiation
AC – amylose content	ET – early tillering
AESA – Agro-ecosystems Analysis	FAO – Food and Agriculture Organization
AEW – agricultural extension workers	Fe – Iron
AG – anaerobic germination	FFA – free fatty acid
AIS – Agricultural Information System	FFP – farmer's fertilizer practice
ANOVA – analysis of variance	FFS – farmers' field school
AON – advance observation nursery	FGD – focus group discussion
AT – agricultural technologist	FI – farmer innovator
AYT – advanced yield trial	FSSP – Food Staples Self-sufficiency Plan
BCA – biological control agent	g – gram
BLB – bacterial leaf blight	GAS – golden apple snail
BLS – bacterial leaf streak	GC – gel consistency
BPH – brown planthopper	GIS – geographic information system
Bo - boron	GHG – greenhouse gas
BR – brown rice	GLH – green leafhopper
BSWM – Bureau of Soils and Water Management	GPS – global positioning system
Ca - Calcium	GQ – grain quality
CARP – Comprehensive Agrarian Reform Program	GUI – graphical user interface
cav – cavan, usually 50 kg	GWS – genomwide selection
CBFM – community-based forestry management	GYT – general yield trial
CLSU – Central Luzon State University	h – hour
cm – centimeter	ha – hectare
CMS – cytoplasmic male sterile	HIP - high inorganic phosphate
CP – protein content	HPL – hybrid parental line
CRH – carbonized rice hull	I - intermediate
CTRHC – continuous-type rice hull carbonizer	ICIS – International Crop Information System
CT – conventional tillage	ICT – information and communication technology
Cu – copper	IMO – indigenous microorganism
DA – Department of Agriculture	IF – inorganic fertilizer
DA-RFU – Department of Agriculture-Regional Field Units	INGER - International Network for Genetic Evaluation of Rice
DAE – days after emergence	IP – insect pest
DAS – days after seeding	IPDTK – insect pest diagnostic tool kit
DAT – days after transplanting	IPM – Integrated Pest Management
DBMS – database management system	IRRI – International Rice Research Institute
DDTK – disease diagnostic tool kit	IVC – in vitro culture
DENR – Department of Environment and Natural Resources	IWM – in vitro mutagenesis
DH L– double haploid lines	IWM – integrated weed management
DRR – drought recovery rate	JICA – Japan International Cooperation Agency
DS – dry season	K – potassium
DSA - diversity and stress adaptation	kg – kilogram
DSR – direct seeded rice	KP – knowledge product
DUST – distinctness, uniformity and stability trial	KSL – knowledge sharing and learning
DWSR – direct wet-seeded rice	LCC – leaf color chart
EGS – early generation screening	LDIS – low-cost drip irrigation system
EH – early heading	LeD – leaf drying
	LeR – leaf rolling
	lpa – low phytic acid
	LGU – local government unit

- LSTD – location specific technology development  
 m – meter  
 MAS – marker-assisted selection  
 MAT – Multi-Adaption Trial  
 MC – moisture content  
 MDDST – modified dry direct seeding technique  
 MET – multi-environment trial  
 MFE – male fertile environment  
 MLM – mixed-effects linear model  
 Mg – magnesium  
 Mn – Manganese  
 MDDST – Modified Dry Direct Seeding Technique  
 MOET – minus one element technique  
 MR – moderately resistant  
 MRT – Mobile Rice Teknoklinik  
 MSE – male-sterile environment  
 MT – minimum tillage  
 mtha<sup>-1</sup> – metric ton per hectare  
 MYT – multi-location yield trials  
 N – nitrogen  
 NAFC – National Agricultural and Fishery Council  
 NBS – narrow brown spot  
 NCT – National Cooperative Testing  
 NFA – National Food Authority  
 NGO – non-government organization  
 NE – natural enemies  
 NIL – near isogenic line  
 NM – Nutrient Manager  
 NOPT – Nutrient Omission Plot Technique  
 NR – new reagent  
 NSIC – National Seed Industry Council  
 NSQCS – National Seed Quality Control Services  
 OF – organic fertilizer  
 OFT – on-farm trial  
 OM – organic matter  
 ON – observational nursery  
 OPag – Office of Provincial Agriculturist  
 OpAPA – Open Academy for Philippine Agriculture  
 P – phosphorus  
 PA – phytic acid  
 PCR – Polymerase chain reaction  
 PDW – plant dry weight  
 PF – participating farmer  
 PFS – PalayCheck field school  
 PhilRice – Philippine Rice Research Institute  
 PhilSCAT – Philippine-Sino Center for Agricultural Technology  
 PHilMech – Philippine Center for Postharvest Development and Mechanization  
 PCA – principal component analysis  
 PI – panicle initiation  
 PN – pedigree nursery  
 PRKB – Pinoy Rice Knowledge Bank  
 PTD – participatory technology development  
 PYT – preliminary yield trial  
 QTL – quantitative trait loci  
 R – resistant  
 RBB – rice black bug  
 RCB – randomized complete block design  
 RDI – regulated deficit irrigation  
 RF – rainfed  
 RP – resource person  
 RPM – revolution per minute  
 RQCS – Rice Quality Classification Software  
 RS4D – Rice Science for Development  
 RSO – rice sufficiency officer  
 RFL – Rainfed lowland  
 RTV – rice tungro virus  
 RTWG – Rice Technical Working Group  
 S – sulfur  
 SACLOB – Sealed Storage Enclosure for Rice Seeds  
 SALT – Sloping Agricultural Land Technology  
 SB – sheath blight  
 SFR – small farm reservoir  
 SME – small-medium enterprise  
 SMS – short message service  
 SN – source nursery  
 SSNM – site-specific nutrient management  
 SSR – simple sequence repeat  
 STK – soil test kit  
 STR – sequence tandem repeat  
 SV – seedling vigor  
 t – ton  
 TCN – testcross nursery  
 TCP – technical cooperation project  
 TGMS – thermo-sensitive genetic male sterile  
 TN – testcross nursery  
 TOT – training of trainers  
 TPR – transplanted rice  
 TRV – traditional variety  
 TSS – total soluble solid  
 UEM – ultra-early maturing  
 UPLB – University of the Philippines Los Baños  
 VSU – Visayas State University  
 WBPH – white-backed planthopper  
 WEPP – water erosion prediction project  
 WHC – water holding capacity  
 WHO – World Health Organization  
 WS – wet season  
 WT – weed tolerance  
 YA – yield advantage  
 Zn – zinc  
 ZT – zero tillage

We are a chartered government corporate entity under the Department of Agriculture. We were created through Executive Order 1061 on 5 November 1985 (as amended) to help develop high-yielding, cost-reducing, and environment-friendly technologies so farmers can produce enough rice for all Filipinos.

We accomplish this mission through research and development work in our central and seven branch stations, coordinating with a network that comprises 58 agencies and 70 seed centers strategically located nationwide. To help farmers achieve holistic development, we will pursue the following goals in 2010-2020: attaining and sustaining rice self-sufficiency; reducing poverty and malnutrition; and achieving competitiveness through agricultural science and technology.

We have the following certifications: ISO 9001:2008 (Quality Management), ISO 14001:2004 (Environmental Management), and OHSAS 18001:2007 (Occupational Health and Safety Assessment Series).
